

REQUIREMENT ANALYSIS – CUSTOMER JOURNEY MAP

Date	29 September 2026
Team ID	6ab800af30f9767f87729b97
Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value
Maximum Marks	As per project requirement

Scenario: Accessing Institution Details Records in ServiceNow

The journey map is adapted from the supplied customer journey map example. The original example uses stages such as Entice, Enter, Engage, Exit and Extend; for this ServiceNow project, the stages are mapped to the user's record-access journey.

Stage	Steps	Interactions	Things	Places / People	Positive Moments	Negative Moments	Areas of Opportunity	Goals & Motivations
ENTICE	User needs to access Institution Details records.	Recognizes the need for a record or task.	ServiceNow application	ServiceNow user / administrator	Clear purpose for accessing records.	Uncertainty about whether access will be allowed.	Provide clear role and access definitions.	Access only the records required for the task.
ENTER	User logs in to ServiceNow and opens Institution Details.	Login and navigation to the table/list.	Login page; Institution Details list	User / ServiceNow	Easy navigation to the required table.	User may not have the required role.	Make role requirements and navigation clear.	Reach the correct records securely.
ENGAGE	User requests to view or perform an operation on a record.	System evaluates the ACL for READ, CREATE, WRITE or DELETE.	Institution Details form/list; ACL layer	User / ACL configuration	Access is granted when conditions are satisfied.	Unauthorized access is denied.	Use role-based and Branch-based ACL checks.	Perform only permitted actions.

EXIT	User completes the permitted operation.	Record is viewed, created, updated or deleted according to permissions.	Institution Details record	Authorized user / administrator	Controlled operation is completed.	Blocked operation if permission is insufficient.	Provide predictable access results.	Complete the task without bypassing security.
EXTEND	Administrator reviews and validates access behaviour.	Impersonation and permission testing.	User Administration; ACL configuration	Administrator / test users	Admin retains full access and can verify permissions.	Incorrect ACL configuration may cause unexpected access.	Regularly test role and Branch combinations.	Maintain secure and controlled record access.

Journey Summary

User logs in → opens Institution Details → requests access → ServiceNow evaluates role and Branch/ACL conditions → permitted operation is granted or denied → administrator validates the access behaviour through testing.
