

PROJECT DESIGN PHASE – PROBLEM–SOLUTION FIT

Date	29 September 2026
Team ID	6ab800af30f9767f87729b97
Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value
Maximum Marks	2 Marks

Problem-Solution Fit means identifying a customer problem and ensuring that the proposed solution actually addresses that problem. The template focuses on customer state, behaviour, triggers, constraints, available solutions, root cause and the proposed solution.

1. CUSTOMER SEGMENT(S) ServiceNow administrators and authorized institution staff who manage Institution Details records.	2. JOBS-TO-BE-DONE / PROBLEMS Control who can view and manage Institution Details records based on user roles and the Branch field; provide separate permissions for READ, CREATE, WRITE and DELETE.
3. TRIGGERS Need to protect institution/student records from unauthorized access; requirement to enforce branch-based record visibility and role-based operations.	4. EMOTIONS: BEFORE / AFTER Before: concerned about unauthorized viewing or modification. After: more confident that access is controlled by defined ACL rules.
5. AVAILABLE SOLUTIONS Standard ServiceNow roles and ACLs, manual permission configuration, and role-based access control. The project extends this with script-controlled evaluation of role and Branch conditions.	6. CUSTOMER CONSTRAINTS Users can only perform actions for which the required ServiceNow role/ACL permission is available. The solution must work within ServiceNow's access-control mechanism and preserve administrator access.
7. BEHAVIOUR User logs in, opens Institution Details, requests an operation, and ServiceNow evaluates the applicable ACL. Administrators configure roles/ACLs and validate behaviour using impersonation.	8. CHANNELS OF BEHAVIOUR ONLINE: ServiceNow web interface, lists, forms and access-control configuration. OFFLINE: Team discussions, requirement review, testing review and demonstration.
9. PROBLEM ROOT CAUSE Record access needs to be restricted at a finer level than general user access. Different users require different permissions, and Branch value must be considered when deciding whether a record can be viewed.	10. YOUR SOLUTION Implement Script-Controlled ACLs on the Institution Details table. READ access evaluates the required role and Branch condition; separate CREATE, WRITE and DELETE ACLs use roles bb2, bb3 and bb4 respectively; administrators retain full access.

Purpose / Vision

Purpose: Provide controlled, role-based and Branch-based access to Institution Details records in ServiceNow.

Vision: Demonstrate a practical record-level security mechanism that prevents unauthorized access while allowing administrators full control.

Problem–Solution Fit Summary

Customer Need	Secure and controlled access to institution records.
Core Problem	Users may require different access rights depending on role and Branch.
Solution Fit	Script-controlled ACLs evaluate role/Branch conditions and control CRUD operations.
Expected Outcome	Authorized access is granted and unauthorized access is denied; administrators retain full access.
