

# PROJECT DESIGN PHASE-II – TECHNOLOGY STACK (ARCHITECTURE & STACK)

|               |                                                                        |
|---------------|------------------------------------------------------------------------|
| Date          | 29 September 2026                                                      |
| Team ID       | 6ab800af30f9767f87729b97                                               |
| Project Name  | Script-Controlled ACL – Restrict Record Access<br>Based on Field Value |
| Maximum Marks | 4 Marks                                                                |

## 1. Architectural Diagram

## 2. Components & Technologies

| Component           | Technology / Platform                      | Project Usage                                                                                       |
|---------------------|--------------------------------------------|-----------------------------------------------------------------------------------------------------|
| User Interface      | ServiceNow Web Interface / Next Experience | Users and administrators access Institution Details through lists, forms and ServiceNow navigation. |
| Application Logic-1 | ServiceNow ACL                             | Controls READ, CREATE,                                                                              |

|                        |                                       |                                                                                                                       |
|------------------------|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
|                        |                                       | WRITE and DELETE access.                                                                                              |
| Application Logic-2    | ACL Script                            | Evaluates administrator access and role/Branch-related access conditions.                                             |
| Application Logic-3    | ServiceNow Roles                      | bb1, bb2, bb3 and bb4 provide operation-specific authorization.                                                       |
| Database               | ServiceNow Platform Database          | Stores Institution Details records and field values.                                                                  |
| Cloud Database         | ServiceNow-hosted platform data store | The project uses the ServiceNow platform's managed data environment; no separate external cloud database is required. |
| File Storage           | Not separately used                   | No external file-storage component is required for the ACL demonstration.                                             |
| External APIs          | Not used                              | No external API is required for the demonstrated ACL workflow.                                                        |
| Machine Learning Model | Not applicable                        | The project does not use a machine-learning model.                                                                    |
| Infrastructure         | ServiceNow Platform / Instance        | Provides the runtime environment for the application, table, roles and ACL configuration.                             |

### 3. Application Characteristics

| Characteristic           | Project Implementation                                                                                                                            |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| Open-Source Frameworks   | No separate open-source application framework is required; the solution is implemented using ServiceNow platform configuration and ACL scripting. |
| Security Implementations | ServiceNow ACLs, role-based authorization, Branch-based access evaluation and administrator full access.                                          |
| Scalable Architecture    | ACL rules can be extended to additional roles, branches, tables and access conditions.                                                            |
|                          |                                                                                                                                                   |

|              |                                                                                                                           |
|--------------|---------------------------------------------------------------------------------------------------------------------------|
| Availability | Depends on availability of the ServiceNow instance/platform.                                                              |
| Performance  | ACL evaluation is performed as part of the ServiceNow access-control process; no external processing layer is introduced. |

**Architecture Flow:** ServiceNow User → Institution Details → ACL Security Layer → Role + Branch Evaluation → Access Granted/Denied → ServiceNow Data Store.
