

Brainstorming & Ideation

Project Title

Script-Controlled ACL – Restrict Record Access Based on Field Value

1. Problem Statement

Educational institutions maintain student records in ServiceNow. If every user can access all records, sensitive student information may be exposed. This project solves the problem by restricting access based on the student's branch using ServiceNow Access Control Lists (ACLs).

2. Project Idea

The project implements a Script-Controlled Access Control List that allows only users with the appropriate role to access records belonging to the EEE branch, while administrators have full access.

3. Objectives

- Implement record-level security using ACL.
- Allow only authorized EEE users to view EEE records.
- Provide administrators with full access to all records.
- Protect sensitive student information from unauthorized users.

4. Scope of the Project

This project focuses on creating users, roles, a custom Institution Details table, and script-controlled READ, CREATE, WRITE, and DELETE ACLs in ServiceNow.

5. Expected Outcome

A secure ServiceNow application where user access is controlled through roles and field values. Only eligible users can view, create, edit, or delete records according to the defined ACL rules.
