

Project Testing

Script-Controlled ACL – Restrict Record Access Based on Field Value

1. Introduction

Project Testing verifies that all Access Control Lists (ACLs) work correctly in the Institution Details table. Different users were tested by impersonation to ensure READ, CREATE, WRITE, and DELETE permissions behaved as expected.

2. Testing Objective

- Verify READ ACL for EEE users.
- Verify CREATE ACL using bb2 role.
- Verify WRITE ACL using bb3 role.
- Verify DELETE ACL using bb4 role.
- Verify Admin has unrestricted access.

3. Test Cases and Results

Test Case	User/Role	Expected Result	Status
Read EEE Records	EEE User (bb1)	Only EEE branch records are visible.	Pass
Read All Records	Admin	All branch records are visible.	Pass
Create Record	EEE User (bb1 + bb2)	New button is available and record can be created.	Pass
Edit Record	EEE User (bb1 + bb2 + bb3)	EEE records can be edited.	Pass
Delete Record	EEE User (bb1 + bb2 + bb3 + bb4)	EEE records can be deleted.	Pass
Unauthorized Access	User without bb1 role	Cannot view Institution Details records.	Pass

4. Testing Procedure

1. Impersonate EEE User and open Institution Details list.
2. Verify only EEE branch records are displayed.
3. Impersonate Admin and verify all records are displayed.
4. Test CREATE, WRITE, and DELETE operations after assigning bb2, bb3, and bb4 roles.
5. Confirm unauthorized users cannot access records.

5. Test Summary

All ACL operations worked successfully. The project achieved record-level security by controlling access through user roles and branch field values.

6. Conclusion

Project testing confirmed that READ, CREATE, WRITE, and DELETE ACLs function correctly in ServiceNow. Administrators have full access, while users receive permissions only according to their assigned roles.
